

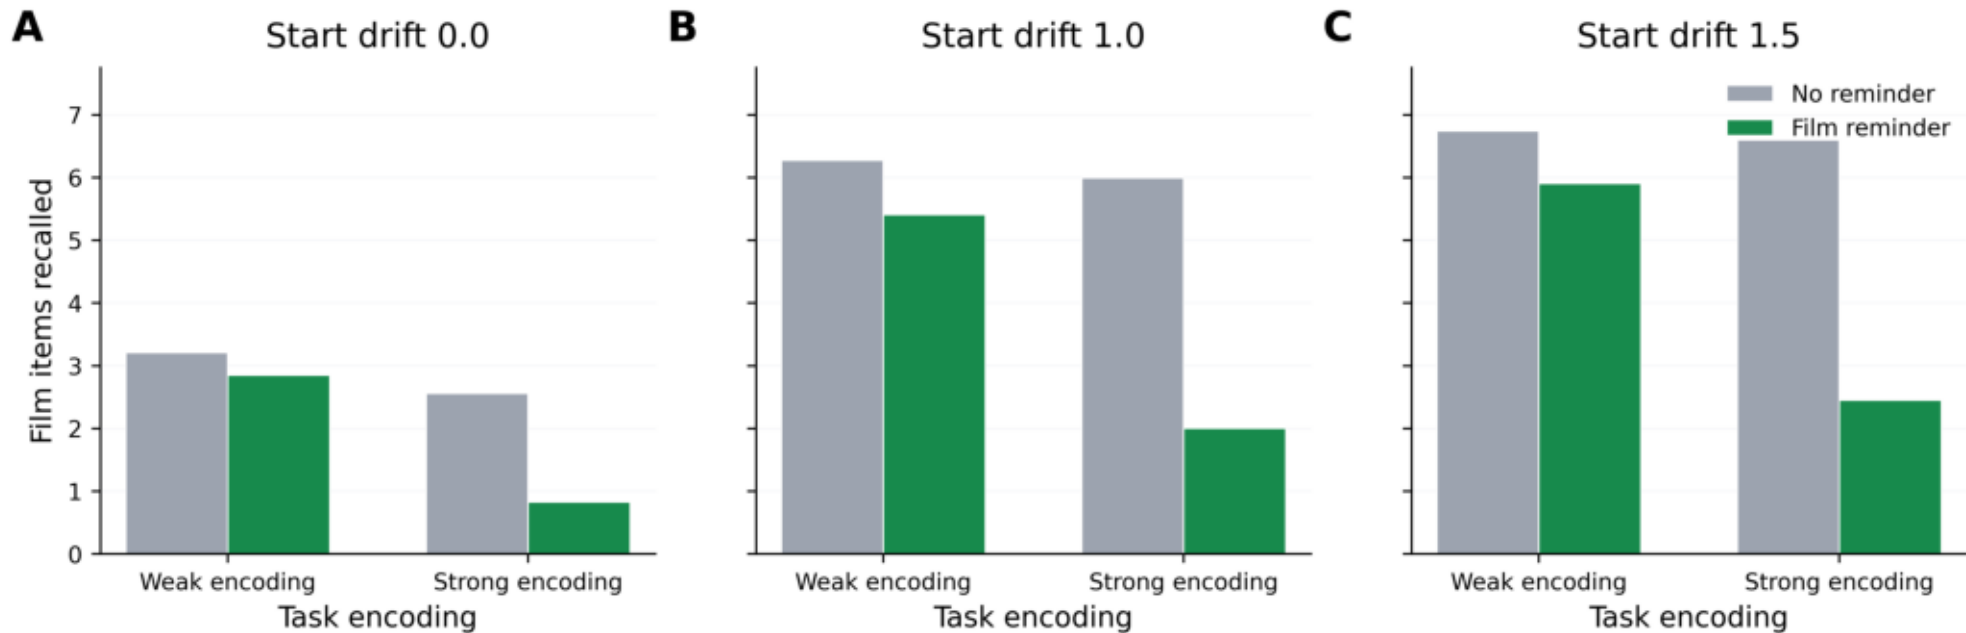

Figure 2 candidate. Start-of-list context reinstatement changes the reminder-by-task encoding pattern.

Bars show expected film items recalled after a supplied film cue before recall begins. Panels vary start drift while keeping the film cue, task-encoding manipulation, and film-source orientation fixed. Higher start drift increases the influence of the start-of-list context at retrieval onset, testing whether the film-reminder loss remains when retrieval is deliberately started from an early-film state.
