

Simulation 1: reminder-linked task encoding redistributes recall probability by encoded position.

Reminder condition and task encoding strength were crossed while retrieval was held unguided; weak film cues were supplied periodically during recall in all conditions. (A) Without a pre-task film reminder, recall probability by encoded position changes only modestly when task encoding is strengthened. (B) With a pre-task film reminder, strong task encoding reduces recall from film positions and increases recall from task positions. Curves compare weak and strong task encoding; shaded bands mark film, break, task, and filler positions, and the green vertical line marks the pre-task film reminder. Task encoding strength therefore changes recall probability by encoded position most clearly when task encoding follows a film reminder.
