

A**B**

Context overlap from reminder reinstatement and film-retrieval goal.

The no-reminder and pre-task-reminder conditions come from the unguided Simulation 1 encoding sequence. The film-retrieval-goal condition holds the pre-task-reminder/strong-task-encoding state fixed, then adds the film-retrieval goal used during deliberate Simulation 2. (A) Mean overlap with task-encoding contexts for each encoded film position, averaging across encoded task positions. (B) Full overlap matrices for the same three cases; each cell compares a film-context-based retrieval cue to the context state active at one encoded task position. Brighter cells indicate greater overlap. The pre-task reminder increases overlap between film-related context and task-encoding context, whereas the film-retrieval goal reduces task overlap with the retrieval cue used during deliberate film recall.
