

A

Endpoint film recall by control setting

B

Absolute film recall reduction

Simulation 2: different retrieval controls preserve film recall to different degrees.

Each control setting was evaluated at two endpoints of the interference manipulation: no reminder with weak task encoding, and film reminder with strong task encoding. Weak film cues were supplied periodically during recall in all conditions. (A) Mean film-item recall for each control setting at the two endpoints. (B) Absolute reduction in film recall from the low-interference endpoint to the high-interference endpoint. Start-of-film reinstatement and retrieval monitoring increase film recall in some conditions, but the smallest endpoint reductions occur when deliberate recall includes a film-retrieval goal.
