

A

Example recall sequences

B

Film output across all trials

Simulation 1: unguided film recall after task encoding.

Reminder condition and task encoding strength were crossed while retrieval mode was held unguided; weak film cues were supplied periodically during recall in every condition. (A) Example generated recall sequences for each condition. Each horizontal lane is one simulated trial selected near the condition mean for film output, with output positions running left to right. Colors mark film items, task items, delay/filler items, and unfilled output positions. (B) Mean number of film items recalled across all simulated trials. Film-item recall was lowest when a film reminder preceded strong task encoding, isolating the unguided-retrieval component of the selective interference effect.
